Title : Intercropping and Irrigation of Cotton with Square-Pocket Distribution of Plants.

Orig Pub : V. sb.: R.f. nauchno-issled. rabot po khlepkovodstvu. Tashkent, AN UzSSR, 1957, 61-77

Abstract : Optimum depth of the longitudinal and lateral cotton cultivation, and also of the irrigation of rows with different plans of plant distribution was determined more precisely at the Ak-Kavakskaya Experiment Station. Planting was done with the seeds of 108-F variety. In all plans of distribution, the best results were obtained with deeper longitudinal and lateral cultivations and with

irrigation. through deeper furrows which is explained by an improvement in the water and physical properties of the soil, good development of the root system and its penetration to a depth of 80-90 centimeters, large accumulation of nitrates in the layer occupied by the roots, better conditions for the infiltration of irrigation water, the tall growth of the main stem, and also by the formation of a large number of sympodial branches and roots. The highest yield was obtained according to the plan: 50 x 50 x 2-3. -- B.L. Klyachko-Gurvich

Title : On Methods of Cotton Irrigation with Narrowed Spaces Between Rows in Square-Pocket Planting.

Orig Pub : Sots. s.-kh. Uzbekistana, 1957, No 12, 16-21

Abstract : Cotton plantings on grass mixture bed with inter-row spaces of 50 centimeters and furrow lengths of 80 meters were carried out in 1956 at Ak-Kavakskaya Experiment Station on an irrigated plot with heavy clayey soils and deep-lying ground waters. The test was started according to the following plan: 1) All 7 waterings into each furrow; 2) the first 2 and the last one of the waterings into every other furrow, the rest - into each furrow; 3) all waterings into every other furrow. The last variant produced a saving in irrigation water of 708-808

Card 1/2

- 72 -

cubic meters/ha. It provided a better protection of the soil from wash-out, increased the pre-frost harvesting of cotton by 1.6-1.9 centners/ha and required less irrigation water when carrying out the irrigation. Experiments carried out in other countries have also shown that it is better to sow every other furrow with narrowed sowing rows, leaving in the next effective one on the continuous sowing cotton on well cultivated soils.

AUTHORS: Gilenko, G. and Kas'yan, O., Graduate Engineers

TITLE: Manual Labor Becomes a Thing of the Past

PERIODICAL: Grazhdanskaya Aviatsiya, 1960, No. 6, pp. 3 - 4.

TEXT: The article refers to the resolution passed by the General Assembly of the TsK KPSS in June 1959 demanding an overfulfilment of the Seven-Year-Plan and full automation of the industry. The following equipment was designed and put into practical use by the workshop supervised by Ferenets: an installation for creolin rinsing of aircraft yearly economy 42,700 rubels; a hoisting device for heavy aircraft units operated from the main hydrostation; power is supplied by a 109A hydraulic pump driven by a 1,5 kw electromotor and supplying 10° (AMG-10) oil; 50 kg/cm^2 pressure is maintained automatically by hydraulic pumps fitted with Il - 12 (Il - 12) operation signalizers; the splicing of wooden floors is performed by a hydraulic press at $0,35 - 1 \text{ kg/cm}^2$, the press consists of three sections and is operated from the main board; pressure is derived from Il - 12 cylinders and the entire machine operated from a hydrostation analogous to that of the

Manual Labor Becomes a Thing of the Past

hoisting device. Dismantling of lower units and landing gear traverses and other operations are carried out by hydraulic engines. As some of these operations require a 25 - 30 ton force, a hydraulic multiplier has been attached to the standard hydraulic power station, allowing a stress increase of up to 250 kg/cm². All mechanical parts of these installations were supplied by УЛ-14 (IL-14), УЛ-12 (IL-12) and Л-2 (Li-2) aircraft. The reducer of a СКД-2 (SKD-2) starter and a 1.7 kw electromotor are used for mechanical tightening of crankshaft bolts. A major economy was achieved by introduction of automatic lathes; they reduced the cost of 1,000 linings from 290 to 60 Rubels and that of bolts from 400 to 61 Rubels (Photograph). The following personnel have taken active part in the automation program: shop managers Plakhotnyy, Petrenko and Zhukov; Graduate Engineers Vishnyak, Pinchuk and Reznik; Foremen Boyko and Tishchenko, Fitters Karlash, Khomenko and Klemba. Photographs on Page 3 show the Foreman D. Gomin-Makukha pressing the bearing into the valve rod and the Outstanding Worker of Communist Labor, Fitter V. Kudryavchenko dismantling a wheel with the aid of an automatic device. The photograph on Page 4 shows the Fitter A. Mel'nichenko lifting a supercharger from the trolley. There are 4 photographs.

TITLE: Improvements to the Static Characteristics of Synchronous
Alternators with Compounded Self-excitation.

PERIODICAL: Vestnik elektropromyshlennosti 1959, Nr 8, pp 42-46
(USSR)

ABSTRACT: For power and high-frequency supplies, extensive use is now
being made of low-output synchronous alternators with
compounded self-excitation derived from metal rectifiers.
This article compares the static and dynamic characteri-
stics of an alternator type ChS-7 230 V, 200 c/s, 14 kVA,
using the excitation circuit of S.B.Yuditskiy and a new
circuit developed by the Leningrad Electro-Technical
Institute imeni Lenin. Yuditskiy's circuit is given in
Fig 1 and it will be seen that the metal rectifiers that
provide the excitation are supplied from a three-winding
transformer. There are two primary windings, one connected
in parallel with the generator terminals and the second in
series with the load. The voltage winding is separated
from the secondary and current windings by a magnetic shunt.

Card 1/4

SOV/110-59-8-10/24

Improvements to the Static Characteristics of Synchronous
Alternators with Compounded Self-excitation.

The external characteristics of a synchronous generator with this method of excitation are plotted in dotted lines in Fig 2, which shows that the voltage variation is about $\pm 6\%$ when the load is raised from zero to rated value and when the power factor alters from unity to 0.3. Fig 3 shows an oscillogram of the current and the generator terminal voltage when rated load at 0.3 power factor is suddenly applied; the greatest voltage-drop is about 22%, and rated voltage is restored in less than 0.1 seconds. With this circuit a remanent voltage of the order of 20 to 25% of the rated value is necessary to ensure reliable self-excitation, and so the rotor must be made of special steel of high coercivity. The oscillograms in Figs 4a and b show the process of self-excitation under various conditions of remanent voltage. Table 1 gives values of generator remanent voltage at which self-excitation occurs, and it will be seen that if the remanent voltage is less than 10 to 15% of rated voltage the generator does not excite.

Card 2/4

SOV/110-59-8-10/24

Improvements to the Static Characteristics of Synchronous
Alternators with Compounded Self-excitation.

More reliable excitation may be obtained by altering the position of the magnetic shunt, but this has disadvantages. This defect of the system of excitation may be overcome by the improved excitation circuit shown in Fig 5. It differs from the previous circuit in having a capacitance connected in series with the voltage winding and in having no magnetic shunt. Because of the capacitance, self-excitation occurs with a remanent voltage of the order of $1\frac{1}{2}$ of the rated value. Consequently, this circuit does not entail the use of special steel in the rotor. The oscillograms of Figs 6 to 8 display the process of self-excitation for various values of remanent voltage and show that the generator fails to excite only if the remanent voltage is less than $1\frac{1}{2}$. A method of design has been derived by which the circuit conditions may be adapted to suit the available remanent voltage. Characteristics of some stabilising transformers designed for different values of remanent voltage are given in Table 2. The presence of capacitance in the circuits of the summing

Improvements to the Static Characteristics of Synchronous
Alternators with Compounded Self-excitation.

transformer also improves the regulation at heavy load and low power-factor. The bold lines in Fig 2 show the external characteristics of a synchronous generator type ChS-7; the circuit of the excitation system is given in Fig 5. When the load is altered from zero to full load and the power factor from unity to 0.3, the voltage variations do not exceed $\pm 5\%$. Fig 9 shows an oscillogram illustrating the sudden application of 100% load at 0.3 power factor. It will be seen that the voltage drop was 22% and that voltage was restored to the rated value in about 0.02 seconds. The characteristics of the systems investigated, their weights and dimensions, are given in Table 3 and indicate that both the original and new voltage regulators are of approximately the same weight and dimensions. There are 9 figures and 3 tables.

TITLE: The Grinding and Honing of Mineral-Ceramic Bits

PERIODICAL: Vestn. sovnarkhoza, 1958, No. 1, pp. 33 - 37

TEXT: The author presents a general conclusion from the Voronezh plant practice of using mineral-ceramic tools, their grinding and honing. He confirms the possibility of end milling refined cast iron, cast steel, welding seams etc., with milling cutters fitted with mineral-ceramic bits. Only mechanical clamping of the bits is recommended for mineral-ceramic tools. A special two-spindle grinding machine has been developed for the grinding and honing of mineral-ceramic bits. One spindle carries the K3 180CM16 (KZ 180SM1B) grinding disk, while on the other a cast iron honing disk is fastened. Grinding is carried out at a peripheral disk velocity of 8 m/sec with manual feeds: a transverse feed in the range of 0.03 - 0.05 mm per double motion and longitudinal feeds between 1 and 1.5 m/min. ✓

The Grinding and Honing of Mineral-Ceramic Bits

Honing is effected with the aid of a paste: 70 % of boron carbide powder of 220 - M28 granularity and 30 % paraffin. The peripheral disk velocity is 1.5 - 2.0 m/sec. The author gives recommendations concerning the sequence of operations during the grinding and honing of mineral-ceramic bits, methods of checking the bits, and the geometry of bits. There are 4 figures.

TITLE: For a Close Liaison With Industry (Za tesnuyu svyaz' s proizvodstvom)

PERIODICAL: Vestnik Vysshey Shkoly, 1958, # 2, pp 31-36 (USSR)

ABSTRACT: The Nauchno-issledovatel'skaya sektsiya tekhniko-ekonomicheskogo soveta Voronezhskogo sovnarkhoza (Scientific-Research Section of the Technical-Economic Council of the Voronezh Sovnarkhoz) has approved a list of themes to be included in the scientific-research work of higher schools, scientific-research, and project-designing organizations, plant laboratories and experimental-technological workshops of enterprises located in this region. There are 16 themes on questions of machine construction and foundry production, 10 on the chemical and rubber industries, and 20 on building material and construction. The total number of recommended problems is 80. The importance of a creative cooperation between the higher school scientists and the staffs of enterprises is stressed. Examples of such cooperation are given.

V.P. Meleshko, Candidate of Chemical Sciences and Dotsent of the Chair of Analytical Chemistry, Voronezh University, together with the engineers of the Voronezhskiy zavod radio-

Card 1/3

For a Close Liaison With Industry

3-58-2-7/33

detaley (Voronezh Plant of Radio Parts) O.V. Chervinskiy and M.N. Romanov have developed a method of water desalination by using ionite.

Professor P.N. Khukhryanskiy of the Lesotekhnicheskiy institut (Forestry Engineering Institute) has, jointly with the industrial workers of a number of Voronezh enterprises, introduced pressed wood pulp as a substitute for metal. As a result, the bushings for supporting bearings of worm screw shafts, previously made of bronze, are now manufactured of pressed wood pulp.

The Chair for the Technology of Binding Materials of the Voronezhskiy inzhenerno-stroitel'nyy institut (Voronezh Engineering and Construction Institute), headed by Dotsent V.V. Pomazkov, developed an economical wall material - autoclave-hardened silicate cellular concrete. The cellular concrete, an artificial material made of sand and lime, has high porosity, but a durability equal to that of bricks. It is 2 - 2.5 times lighter than brick and floats on water.

Some fields in which work should be done are: the utilization of cord waste, burned rubber and other production waste of the Voronezhskiy shinnyy zavod (Voronezh Tire Plant). The developing of methods to measure residual stresses in machine

Card 2/3

For a Close Liaison With Industry

3-58-2-7/33

parts produced by welding and casting, and in parts subjected to thermal treatment, the developing of air tight rubber for tubeless tires, the utilizing of 20,000 cu m of sawdust and shavings of the Voronezh enterprises for the manufacture of construction material, the chemical purification of industrially used water, the refining and regenerating of a number of valuable chemicals used by industry in large quantities (acids, electrolytes in galvanic workshops, solutions used in the food industry) the recovery of valuable metals carried away by waste waters, the separation of mixtures of valuable and rare metals used in the semiconductor industry.

The cement factories of the Voronezh economic region still need efficient devices for capturing cement dust; the purifying of smoke-gas from cement-burning furnaces is still a problem. A rational utilization of the industrial waste of meat combines is needed.

The Scientific-Research Section considers it necessary to invite the vuz scientists to participate in the work of plant laboratories as consultants and supervisors.

TITLE: Granulating the Cupola Slag (Granulyatsiya vagranochnogo shlaka)

PERIODICAL: Mashinostroitel', 1958, # 2, p 34 (USSR)

ABSTRACT: The article describes an arrangement - suggested by foundry foreman I.M. Moiseyev of the plant "Voronezhsel'mash" - for handling cupola slag which was formerly tapped straight on the cupola aisle floor. The described arrangement consists of a sheet metal trough, covered with a hood, mounted on the cupola at the slag tap hole, and two water pipings with sprayers. The steam and the rapid cooling cause the slag to bake and break (granulate) into small pieces. Water and slag flow down into a perforated metal bin in a concrete pit in the floor. The water flowing from the perforated bin is drained off, and the bin with the slag is removed with an electric telpher.

TITLE: Grinding and Lapping Mineral-ceramic Tip-Plates (Zatochka i dovodka mineralokeramicheskikh plastin)

PERIODICAL: Mashinostroitel', 1958, # 3, p 27-28 (USSR)

ABSTRACT: Mineral-ceramic cutting tools have been introduced into used at Voronezh machine building plants and have proved superior to carbide tools.

The author gives general recommendations for grinding and lapping mineral-ceramic tip-plates. The information concerns the shape of tip-plate cutting surfaces and of grinding wheels, the abrasives, the coolant, the lapping compound, and the grinding and lapping operations. Grinding wheels made of green silicon carbide bound with bakelite are recommended as the best.

The author suggests a special design for a grinding-and-lapping machine for mineral-ceramic tip-plates.

There are 3 figures.
